

UTILITY ASSET INTELLIGENCE

BY TEAM JARVIS

AI • GIS • ASSET INTELLIGENCE

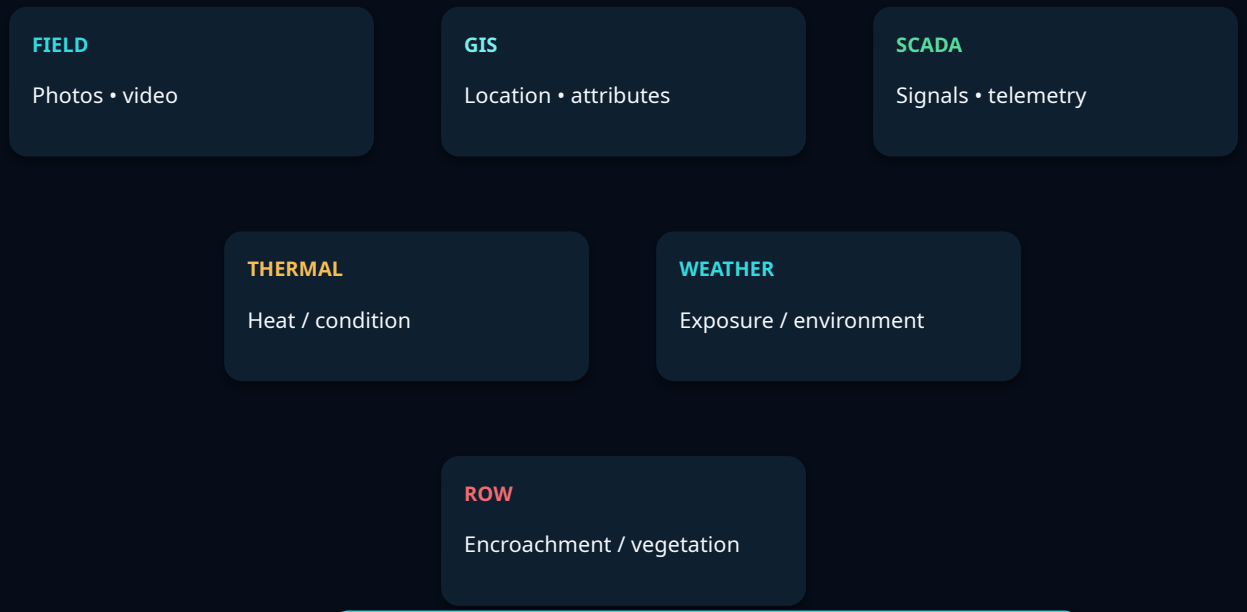

Utilities have assets. They need asset intelligence.

Maintenance decisions are increasingly data-rich — but the intelligence layer between observation and action is fragmented.

THE SCALE OF THE PROBLEM

Inspecting an asset is not the same as understanding it.

At utility scale, people must connect images, GIS identity, history, telemetry and environmental context before they can quantify risk or decide what to do.

THE NIX OPPORTUNITY

A digital inspector that sees minute signals at scale — then turns them into quantified, explainable decisions.

MISSING LAYER

Observe → Understand → Quantify → Prioritize

One intelligence layer. Many utility workflows.

NiX amplifies the people already collecting, mapping, inspecting and maintaining infrastructure.

PRIMARY USER

Engineers & Inspectors

Investigate evidence
Validate condition
Decide next action

UAS / AVIATION

Drone imagery at scale

Automatically inspect, classify and geo-link observations.

INSPECTION TEAMS

Ground + remote inspection

Surface minute defects, anomalies, encroachment and vegetation.

LEMUR / MOBILE MAPPING

Field-collected asset data

Turn every captured observation into structured asset intelligence.

MAINTENANCE / OPERATIONS

Risk-ranked work

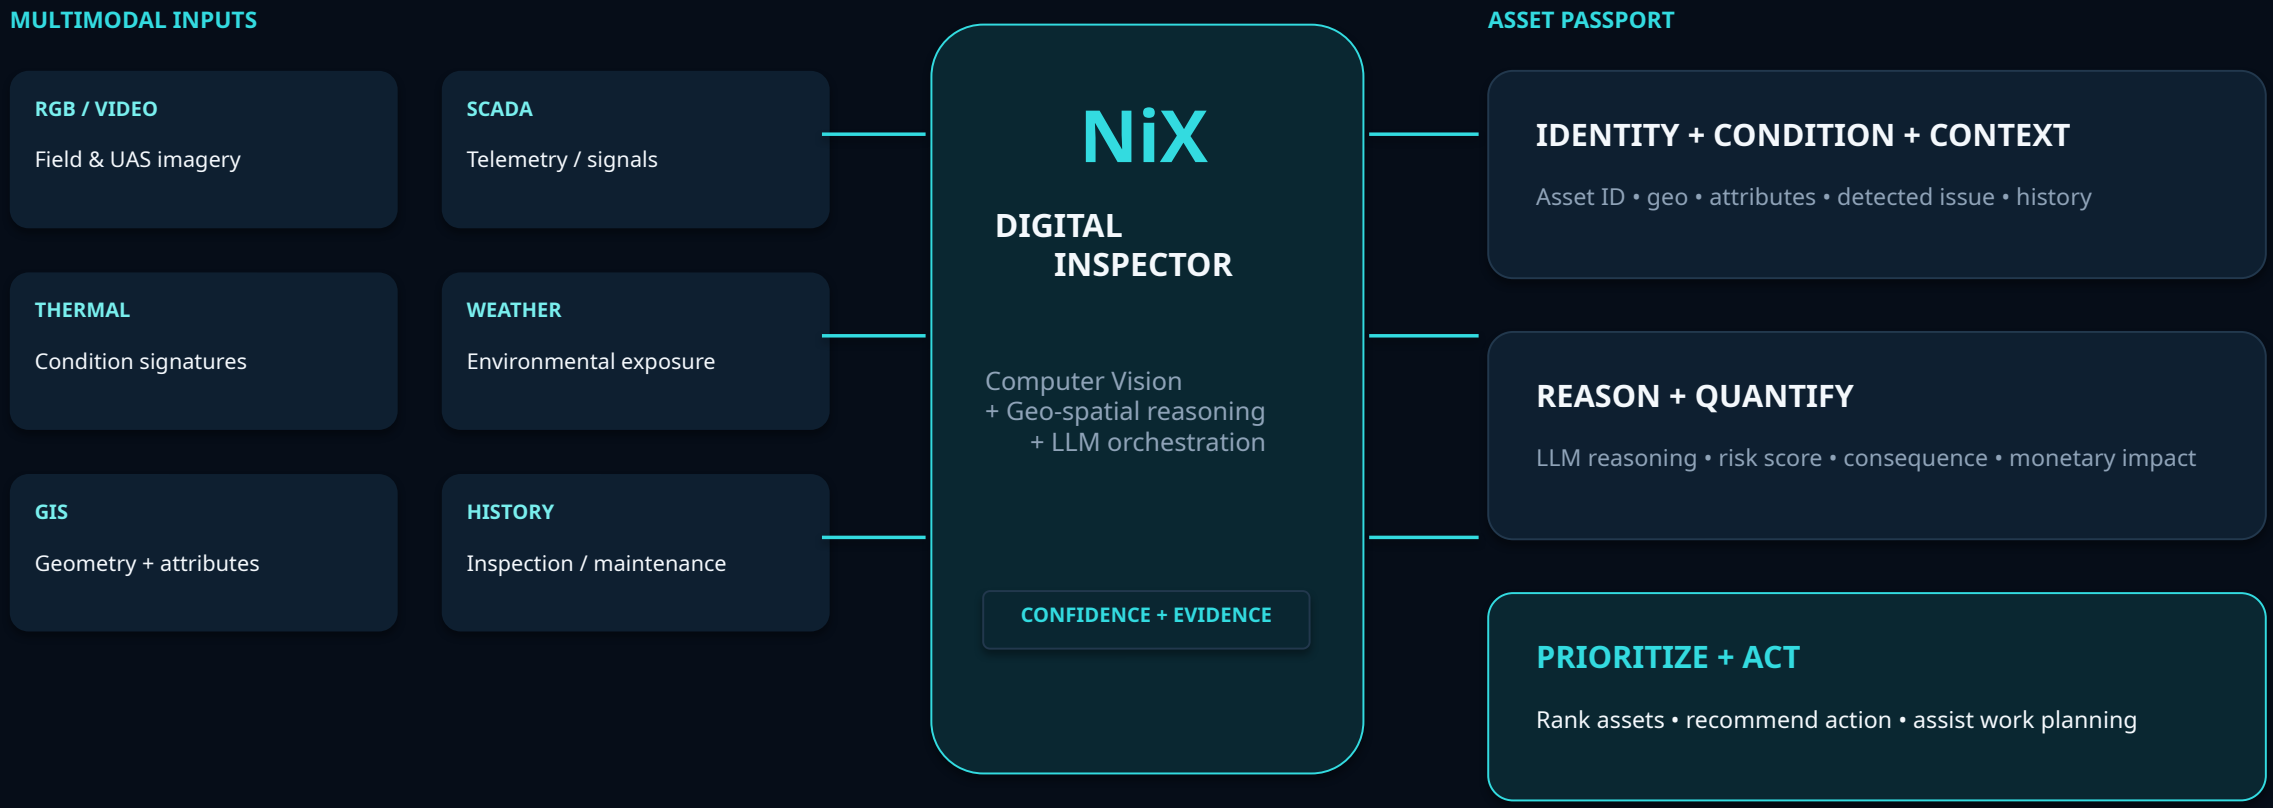

Quantify consequence, prioritize assets and optimize visits.

WHERE COMPUTER VISION + GIS + IMPACT ANALYSIS FIT

Condition tagging • defect localization • asset matching • encroachment • inspection prioritization

The NiX Intelligence Layer turns observations into decisions.

Every observation is anchored to a real asset, enriched with context, reasoned over, scored and converted into an actionable priority.

DECISION SIGNAL **Observed condition × consequence × contextual exposure → risk → priority → action**

From an imagery repository to a living Asset Passport.

NiX does not replace the systems NiSource is building. It makes their data more intelligent by adding a decision layer on top.

TODAY

Collect → map → store → inspect

UAS / mobile mapping / field inspection create a growing body of asset imagery and spatial information.

IMAGERY	More observations
GIS	More precise asset identity
OPERATIONS	More history and signals

→

NIX FUTURE

A living intelligence layer for every asset.

SEE	CV finds what people may miss
LOCATE	GIS anchors it to the right asset
REASON	LLM connects attributes + history
QUANTIFY	Risk + consequence + $ impact
ACT	Prioritized, explainable assistance

THE SHIFT **From “Where is the asset data?” → “What is happening to the asset, why, and what should we do?”**

Make every inspection, engineer and maintenance dollar more intelligent.

A scalable decision layer turns the growing volume of asset data into measurable operational leverage.

01 **LESS MANUAL TRIAGE**

AI reviews imagery at scale and surfaces minute anomalies for human validation.

02 **FEWER MISSED SIGNALS**

Computer vision consistently scans large image volumes for subtle condition changes.

03 **SMARTER SPEND**

Quantify risk and monetary impact so teams prioritize the assets that matter most.

04 **FASTER FIELD ACTION**

Give engineers an Asset Passport and explainable recommendations instead of fragmented evidence.

DEPLOYMENT PATH ONE ASSET CLASS → ONE OPERATING AREA → REAL DATA → MEASURE → SCALE

The long-term vision:

a utility-wide Asset Intelligence Platform that assists engineers, optimizes workforce decisions, and moves maintenance from reactive to proactive.
